Project Summary

Project Summary
The summary below provides a quick understanding of our scope of work and general testing procedures. Enclosed in the report are further details about your building performance including recommendations, asset data, and pictures. Our focus is to work with the trades to remedy any issues or deficiencies during the actual field balancing and not after the balancing has occurred to achieve a positive environment and outcome. The level of success is determined by the availability of the trades, possible parts needed, or time constraints.

RTU's (Roof Top Units)
Each of the RTU's was measured with a flow hood to establish total flow. The total flow was then adjusted via the VFD so that airflow fell within design tolerances. All diffusers on the kitchen RTU were balanced to the engineer's design flow. The diffusers on the sales floor were only adjusted when there were noticeable issues present like drafting or dampers that were found completely closed. The Hoods On outside air rate was set by first establishing the typical QT set point at the Emerson controller and then making manually adjustments on the roof. The hoods off airflow setpoint was found by adjusting the damper position at the Emerson controller until the design airflow was achieved. Outside air was measured by reading the intake air opening with a velocity grid and multiplying by the free area. After completion of TAB all overrides were released.

Kitchen Exhaust Hood & Associated Fans
The kitchen exhaust fan was measured at the hood filter bay utilizing a velocity matrix and a manufacturer's correction factor. Each filter velocity is multiplied by the manufacturer's corrected area. The sum of these readings equals the total flow of the exhaust fans. The total flow of the exhaust was then adjusted to within tolerance of the design flow.

Restroom Exhaust Fans
The restroom exhaust fans were measured with a flow hood. The total flow was balanced for the fan with the exception of the new grille over the combi-oven, which was balanced to the listed design.

Final Building Tests
After completing the test and balance the final building pressure was measured. It was confirmed that the building pressure fell within acceptable tolerances and that the pressure measurement coincides with the actual and design net airflow. Any deviations from these standards are noted throughout the report. The hood capture was tested at the perimeter of the hood and the cook top level with the equipment heat on to ensure satisfactory hood capture and containment.

Issue List

- DAMPERS INACCESSIBLE
- GRILLE INACCESSIBLE
- HINGE OR CUP INSTALLED ON WRONG SIDE
- HOOD FAILED SMOKE TEST AT MAX
- MSC NOT PROPERLY INSTALLED

12-08-25 QT #1439 MESA, AZ

Project Issue Information

Issue Name : DAMPERS INACCESSIBLE

Description : RTU3 dampers should be accessible for TAB to done properly. Tiles cannot be move due to proximity of light canisters to steel beams and the hood. They are installed too far in to be reached on either side of row of lights. Recommend not installing tiles until kitchen has been balanced.

12-08-25 QT #1439 MESA, AZ

Project Issue Information

Issue Name : GRILLE INACCESSIBLE

Description : RTU2-5 grille is in the wrong place and is inaccessible. Damper was closed, after I measured for total flow I opened it so the back area would be conditioned. Equipment is largely blocking airflow, however.

12-08-25 QT #1439 MESA, AZ

Project Issue Information

Issue Name : HOOD FAILED SMOKE TEST AT MAX

Description : Grilles were adjusted, hood exhaust turned up to +8-10% over design (max allowed), smoke test still failed. Smoke escapes mostly from panel side(left), and a small amount from right-front.

Created By :	National TAB	**Assigned To :**	National TAB - Dan Hertenstein

SIDE	0.003
REAR	
AVERAGE	**0.0035**

NOTES:

Building is barely neutral w/ Hood On. Recommend fixing exhaust design so hood fan can be turned back down to design (instead of ~10% over), and installing combi-oven exhaust with TAB present so it can be properly balanced - or make the exhaust accessible in some other way. OA left on 'high side' to make-up for higher exhaust. Rear door air curtain could not be shut off as usual without

CheckList List

Completed By: Christine Weale on 12/10/2025

Notes:
WOMEN'S BATHROOM AIRFLOW EXTREMELY LOW. HVAC SHOULD LOOK INTO CAUSE. DAMPER INACCESSIBLE DUE TO SHELVES.
UNIT PRESSURES ARE PRETTY HIGH, SOME REGISTERS READ LOW, AND UNITS ARE RUNNING AT MAX - RECOMMEND HVAC CHECK ALL DAMPERS/DUCT FOR RTU1&2.
